Sample Questions and Model Answers from 2007

Here, we explore typical questions from the 2007 senior biology 2 paper and summarize the model responses.

Question 1: Describe the structure and function of the plasma membrane.

Model Answer:

The plasma membrane is a phospholipid bilayer embedded with proteins, which surrounds the cell and regulates what enters and exits. The phospholipids have hydrophilic heads facing outward and hydrophobic tails inward, creating a semi-permeable barrier. Proteins serve various functions, such as transport, signaling, and structural support. Cholesterol molecules are interspersed within the bilayer, maintaining fluidity. The membrane's fluid mosaic model allows flexibility and dynamic movement of components, essential for cell function.

Question 2: Explain how genetic mutations can lead to variations in a

population.

Model Answer:

Genetic mutations are changes in the DNA sequence that can occur spontaneously or due to environmental factors. Mutations may alter gene function or expression, leading to phenotypic variations. For example, a mutation might change a protein's structure, affecting its activity. Such variations can be beneficial, harmful, or neutral. In a population, beneficial mutations may confer advantages, increasing survival and reproductive success, thus contributing to evolutionary change through natural selection.
